REFLECTIONS ON TEACHERS’ CLASSROOM EFFECTIVENESS AND STUDENTS’ ACADEMIC PERFORMANCE IN PUBLIC SENIOR SECONDARY SCHOOLS IN ABIA STATE

Solomon Iheonunekwu; Christian Nwamuo, (Ph.D) and Helen Ukpabi, (Ph.D)

Abstract
This study is on Teachers’ Classroom Effectiveness and Students’ Academic Performance in Public Secondary Schools in Abia State, Nigeria. It was a descriptive survey that adopted an ex-post-facto research design and it involved 979 teachers comprising 450 males and 519 females drawn from 72 out of 361 public Secondary Schools in Abia State using stratified random sample technique. The academic performances records of 50 students per teacher were used for the study totaling 48,950 students. Two questionnaires and a rating scale were employed to collect data for study. Cronbach’s alpha value of .98 and .79 respectively were obtained from the two questionnaires used for the study. Four null hypotheses were tested at the .05 level of significance using correlation, simple regression, t-test, and single factor analysis of variance. The results showed that effective teachers produced better performing students. However, the differences observed in students’ academic performance were statistically not significant; this could be as a result of the influence of students’ and school environment related factors which were not included in this study. The paper concluded that teachers’ classroom effectiveness have only a minimal influence on the academic performance of students in public secondary schools in Abia State.

The issue of poor academic performance of students in Nigeria has been of much concern to all and sundry. The problem is so much that it has led to the widely acclaimed fallen standard of education in Abia State and Nigeria in general. The quality of education depends on the teachers as reflected in the performance of their students. Over the years students’ academic performance in both internal and external examinations had been used as a measure to determine excellence in teachers and teaching (Ajao, 2001). Teachers have been shown to have an important influence on students’ academic achievement and they also play a crucial role in educational attainment because the teacher is ultimately responsible for translating policy unto action and principles based on practice during interaction with the students (Afe, 2001).

According to Federal Republic of Nigeria (2004:39) “no education system may rise above the quality of its teachers”. In the words of Uchefunna (2001) teaching and learning depends on teachers, no wonder an effective teacher has been conceptualized as one who produces desired results in the course of his duty as a teacher.

Teaching effectiveness has been accepted as a multidimensional construct since it measures a variety of different aspects of teaching such as; subject mastery, effective communication, lesson preparation and presentation (Onyeachu, 1996). The influence of teachers’ teaching effectiveness on the learning outcome of students as measured by students’ academic performance has been the subject of several studies (Adediwura and Tayo, 2007; Adu and Olatundun, 2007; Lockheed and Komenan, 1988; Schacter & Thum, 2004; Starr, 2002). The above studies suggest that effective teaching is a significant predictor of students’ academic achievement. Therefore effective teachers should produce students of higher academic performance.

Journal of Qualitative Education, Volume 8 No. 1, May, 2012, ISSN: 0331 – 4790
Poor academic performance of students in Nigeria has been linked to poor teachers’ performance in terms of accomplishing the teaching task, negative attitude to work and poor teaching habits which have been attributed to poor motivation (Ofoegbu, 2004). It has also been observed that conditions that would make for effective teaching such as resources available to teachers, general conditions of infrastructure as well as instructional materials in public secondary schools in Nigeria are poor (Oredein, 2000). These prevailing conditions would definitely show a negative influence on the instructional quality of teachers in public schools, which may translate to poor academic performance, attitude and values of secondary school students.

Although teachers’ strong effect would significantly influence students’ academic achievement, other factors such as socio-economic background, family support, intellectual aptitude of student, personality of student, self-confidence, and previous instructional quality have been found to also influence students’ examination score (Starr, 2002) either positively or negatively. To this end, Blankstein (1996) had stated that students’ grades and test scores are not good indicators of the quality of teachers’ instruction. In support of this view, a study carried out in Nigeria by Joshua and Kritsonis (2006) showed that Nigerian teachers condemn the use of student achievement scores as indicators of teachers’ competence, performance of effectiveness.

Since students’ academic scores are not the only predictors of teachers’ effectiveness, researchers like Emeterom (2005), Enaohwo (2000), Emenalo (2009), Eze and Egwuagu (1984) and Eze (2000) have sought other fairer ways of evaluating teachers’ effectiveness. Students, administrators, Peers and the teachers’ self evaluation have been used to evaluate teachers’ effectiveness. Students’ competence in the evaluation of the effectiveness of their teachers has been of great concern to researchers in education. However, studies have shown that students’ ratings are valuable indicators of teachers’ effectiveness (Barnett, Matthews & Jackson, 2003; Imhanlahini & Angell, 2006; Pozo-Munoz, Rebollos-Paceco and Fernandez-Ramirez, 2000). Despite the fact that there is research reports in support of students’ rating of their teachers’ effectiveness, Nuhfer (2004) and Pozo-Munoz, Rebollos-Paceco and Fernandez-Ramierz (2000) warned that students rating should be one of comprehensive evaluation systems and should never be the only measure of teachers’ effectiveness.

The school administrators’ evaluation has also been used to evaluate teachers’ effectiveness. The accuracy of school administrator’s evaluation of teachers effectiveness has also been studied, Jacob and Lefgren (2006) found a positive correlation between a principal’s assessment of how effective a teacher is at raising students’ achievement and that teacher’s success. The above study suggests that administrator’s rating may also be one of comprehensive evaluation systems to measure teachers’ effectiveness in secondary schools. The literatures reviewed indicate that effective teachers positively influence the academic achievement of their students. However, students’ related factors were also found to have influence either positively or negatively on students’ academic performance.

Statement of the Problem
Considering governments’ huge investment in public education, its output in terms of quality of students has been observed not to be reciprocal with government expenditure. Consequent upon the observed decline in the academic achievement, attitude and values of secondary school students in public secondary schools one wonders if the high failure
rates and the poor quality of the students is not a reflection of the instructional quality in the schools. In other words the ineffectiveness of teachers in classroom interaction with the students could be responsible for the observed poor performance of students and the widely acclaimed fallen standard of education in Nigeria. This study was designed to determine if teachers’ classroom effectiveness significantly had any influence on the academic performance of students in public secondary schools in Abia State. It was aimed at answering the question: “Does teachers’ classroom effectiveness have significant influence on student academic performance?” In answering this question, the study determined and described the relationship between teachers’ effectiveness and the academic performance of students. It also determined whether there is significant difference in the mean performance of students taught by ineffective and very effective teachers. Finally useful recommendations were made based on the results of the study. This study is significant because the results will enable researchers to proffer useful suggestions on the ailing problems of poor academic performance of students.

Null Hypotheses

The following null hypotheses were formulated and tested at .05 level of significant

There is no significant relationship between teachers’ effectiveness and students’ academic performance in public senior secondary schools in Abia State.

There is no significant difference in the mean effectiveness rating of teachers and the mean academic performance of students in public senior secondary schools in Abia State.

There is no significant difference in the academic performance of students taught by ineffective, moderately effective and highly effective teachers in public senior secondary schools in Abia State.

There is no significant difference in the mean performance of students taught by highly effective teachers and those taught by ineffective teachers in public senior secondary schools in Abia State.

Method
Research Design

This study was a descriptive survey that employed an ex-post-facto design that involved the determination and description of the influence of teachers’ effectiveness on students’ academic achievement. The ex-post-facto design is considered appropriate because the events had already taken place and the researcher cannot manipulate the variables.

Population for the Study

This is made up of eleven thousand, four hundred and ninety-nine (11,499) teachers in Public Senior Secondary Schools in Abia State.

Sample and Sampling Technique

A sample of one thousand one hundred and fifty (1,150) teachers were drawn from a total of eleven thousand, four hundred and ninety-nine (11,499) teachers in public secondary schools in Abia State using stratified random sampling technique. The teachers were drawn from seventy-two (72) out of a total of three hundred and sixty-one (361) public secondary schools in the State as at 2009-2010 school years. The seventy-two secondary schools used comprised eight (8) schools each from Urban, Semi-Urban and Rural locations in each of the three senatorial districts of the State. Stratification ensured an even distribution of subjects used in the study. The academic performances records of 50 students per teacher were used for the study totaling 48,950 students.

Instrumentation

The instruments adopted for the study were two questionnaires and one rating scale.
The questionnaires tagged Teacher Effectiveness Questionnaire I and II (TEQI & TEQII) were designed respectively for school administrators and students to evaluate the teaching effectiveness of the sampled teachers in each school. The questionnaires sought information on the teachers’ effectiveness in the area of subject mastery, lesson preparation and presentation, punctuality and attendance in class, clear communication, adequate use of instructional materials, creativity and resourcefulness, adequacy of teachers’ evaluation of students’ academic work and teachers’ concern for students. The questionnaires contained twenty-two structured items whose scores were graded in a four-point modified Likert’s scale with 4 being very high and 1 being very low in the attribute in question. The instruments were face validated, and then construct validity by factor analysis using Statistical Package for Social Sciences (SPSS) version 12.0.

For the reliability of the instrument, Cronbach’s coefficient alpha values of .98 and .79 were obtained for Teacher Effectiveness Questionnaires I and II respectively. The rating scale, tagged Student Academic Performance Rating Scale (SAPRS) was designed to enable the researcher evaluate the academic performance of students taught by the sampled teachers from 2006/2007 to 2008/2009 school years. The raw scores of fifty randomly selected students taught by each participant teacher were used to measure the academic achievement of each participating teachers’ student. The researcher and research assistants obtained the students’ raw scores from the academic records in the respective schools. The student scores were scaled from 1 to 4 using the quartile ranks. Scores in the first quartile corresponded to one point while scores in the fourth quartile corresponded to four points in a four-point Likert’s scale.

Data Collection
The questionnaires were administered to the respondents on the spot. A total of nine hundred and seventy-nine (979) usable questionnaire sets were returned, signifying a response rate of 85%. The researcher and research assistants obtained scores of a total of 48,950 students directly from the academic records in the sampled school. The distribution of subjects used for the study is shown in table I.

Data Analysis
The analyses used data from surveys and administrative records. The measures of teachers’ effectiveness ranged from 1 to 4, with higher values corresponding to a greater quantity of a particular attribute. The students’ scores were also scaled from 1 to 4 using the percentile ranks. Scores in the first percentile corresponded to one point, while scores in the fourth percentile corresponded to four points on a four point Likert’s scale. The analysis centered on testing the three null hypotheses to determine and described the influence of teacher’s effectiveness on students’ academic performance. Teachers rated below 40 in the effectiveness measure are ineffective, between 40 and 60 are moderately effective while those rated 70 and above are highly effective. One factor analysis of variance (ANOVA), t-test, Pearson Product Moment correlation and simple regression analysis were used to test the hypotheses. All hypotheses were tested at 0.05 level of significance or 95% certainty of prediction.

Results
Hypotheses I
There is no significant relationship between teachers’ effectiveness and students’ academic performance in public senior secondary schools in Abia State.

Predictor:
- Teachers’ Effectiveness Rating (TER)
- Dependent Variable: Students’ Academic Performance Rating (SAPR)

There is no significant relationship between teachers’ effectiveness and students’ academic performance. Pearson product moment correlation and simple regression analyses were used to test this hypothesis. The results are displayed in tables 2 and 3. Table 2 shows that there is a very weak negative correlation between teachers’ effectiveness and students’ academic performance. Table 3 shows that teachers’ effectiveness contributed only .7% (R squared = .007; p<.05) to the variance in student academic performance. This contribution is significant with a negative t value (t = -2.7; p<.05). Therefore, the null hypothesis was discarded and it was concluded that there is a significant negative relationship between teachers’ effectiveness and Students’ Academic Performance in public secondary schools in Abia State Nigeria. It is noteworthy that 99.7% of the variance in students’ academic achievement in this study is attributed to non-teacher effects.

Hypothesis 2 There is no significant difference in the mean effectiveness rating of teachers and the mean academic performance of students in public senior secondary schools in in Abia State.

**TER** = Teachers Effectiveness Rating: P < .05  
**SAPR** = Students’ Academic Performance Rating

To test this hypothesis, one factor analysis of variance (ANOVA) was used. Table 4 shows that F-calculated (F=3043, 758; p<.051) is higher than F-critical (3.846). Therefore the null hypothesis was discarded and it was concluded that there is a very significant difference in the mean effectiveness rating of teachers and the mean academic performance of students. The mean teachers’ effectiveness rating is significantly higher than the mean of students’ academic performance in Abia State public secondary schools of Nigeria.

**Hypothesis 3** There is no significant difference in the academic performance of students taught by ineffective, moderately effective and highly effective teachers in public senior secondary schools in Abia State.

INEF = Ineffective Teachers. MODEET = Moderately Effective Teachers. HIGET = Highly Effective Teachers. P < .05

One factor analysis of variance was used to test this hypothesis. The result of the analysis shows that F-calculated (0.925, p<.05) is lower than F-critical (3.005, p>.05). This indicates that the mean difference of students’ academic performance is not significant hence the null hypothesis was retained. It was concluded that there is no significant difference in the performance of students taught by ineffective, moderately effective and highly effective teachers in public secondary schools in Abia State, Nigeria.

Hypothesis 4 There is no significant difference in the mean performance of students taught by highly effective teachers and those taught by ineffective teachers in public senior secondary schools in in Abia State.

Journal of Qualitative Education, Volume 8 No. 1, May, 2012, ISSN: 0331 – 4790
To test this hypothesis t-test of two samples of unequal variances was used and the result is shown in Table 6. The result of the t-test analysis shows that there is no significant difference in the mean performance of students taught by ineffective and highly effective teachers. Therefore the null hypothesis was retained.

**Discussion**

The study found that teachers who were rated as ineffective actually produced students of lower academic ability. However, the difference found in the mean performance of the students was statistically not significant. This agrees with the earlier studies of Adu and Olatundun (2007), Lockhead and Komenan (1988) and Maduka (2000), which indicated that effective teachers produced high performing students. It is noteworthy that the mean performance of students in this study was lower than the mean effectiveness rating of the teachers. This shows that the teachers are significantly more effective than what the academic performance of the students indicates. The reported level of students’ performance may not be a good reflection of the quality of teaching in the schools. It may be more of the function of the quality of students and the environment of learning in public secondary schools. Generally, the students in public secondary schools in Abia State of Nigeria are from poor homes, with little or no educational materials at home. The parents of this set of students are often partially educated and sometimes they are illiterate. The students come into the schools with low intellectual ability and poor attitude to academic work. Therefore, the student factors may be more responsible for the reported level of student performance in these schools than teachers’ effectiveness. The school environment is such that classrooms are overcrowded in urban schools, the infrastructure and facilities in these schools are inadequate and so it becomes impossible for good teaching and learning to take place. This poor state of schools makes students restive and uninterested in academic excellence. A possible consequence of this is that students’ and school environment factors may have marked the actual influence of teachers’ classroom effectiveness. This is especially noticed in the variation of performance of students of ineffective and moderately effective teachers where the former produce students with higher mean performance contrary to expectation.

The results of this study is in agreement with the statement of Blankstein (1996) that students’ grades and test scores do not reflect the quality of instruction because teachers’ input is not the only factor that influences student academic performance in schools. Also in support of this study, Joshua, Joshua and Kritsons (2006) concluded that teachers condemn the use of students’ scores to evaluate their effectiveness and performance. Starr (2002) had identified peer influence, race, ethnicity, gender, motivation, income, intellectual aptitude of the student, personality of student, self confidence, previous instructional quality received by student, house hold environment, and parental education as student related factors that influence the academic performance of students, in further support of these views. However, the study is not consistent with the studies of Schacter and Thum (2004) and Starr (2002), which found a high correlation coefficient between teachers’ effectiveness and students’ academic performance.

**Conclusion**

Teachers’ classroom effectiveness has been found to have only a minimal influence on the academic performance of students in public secondary schools in Abia State, Nigeria. This is due to the fact that teachers’ effect is not the sole determinant of students’ academic outcome.
Students’ related factors such as intelligence, parental education, socio-economic status, and personality which vary over wide margins in the study area may have significant effect in the academic performance of students in public secondary schools. School environment related factors such as class size, infrastructure and facilities available in the schools may also influence significantly on the academic performance of students and may be responsible for the observed low performance of students when compared with the effectiveness of their teachers.

**Recommendations**

Government should attempt to improve the attitude of students to academic work by providing libraries and laboratories for science practical, so that the learning experiences of the students can become more meaningful and at the same time interesting. There is the need to build more classrooms and make more adequate provision for seats especially in urban schools to ease the problem of overcrowded classrooms and poor sitting arrangement that presently make teaching and learning difficult in public secondary schools. This will further improve effective classroom control for better teaching and learning to take place in the schools. The school principals should endeavor to make necessary instructional materials available to teachers when needed. The staff rooms should also be conducive for teachers to adequately prepare their lessons. This will motivate teachers to do better in their interaction with students. The preparation of students admitted into the schools should be dependent on the available space and facilities. There should be a reasonable match between student population and available resources in the admission process. Finally, teachers should bring their teaching to the level of the students’ aptitude and make classroom interactions more interesting so as to arouse the interest of the students to academic excellence. This would go a long way in solving the problem of poor academic performance of public secondary school students and the widely acclaimed fallen standard of education in Abia State, Nigeria.
